COP2806C Module 7 Programming Assignment: Letting Spring Build Your Data Access Objects

In this assignment we will work with the Spring Data implementation of JPA.

The GitHub Classroom assignment repo contains the full Chapter 7 project content from our textbook, but it will not build because the Document class is (mostly) empty. Recreate the file from the listing provided in the textbook to implement a Spring Data Entity, including all required properties, accessors, and mutators. Be sure to properly annotate the class.

Submit your changes to the repo and include a screen snip showing successful test execution from the command line after making the modifications.
